

JET PROPULSION LABORATORY  
NOTIFICATION OF CLEARANCE

01/18/02

TO: P. Liewer  
FROM: Logistics and Technical Information Division  
SUBJECT: Notification of Clearance - CL#02-0154

The following title has been cleared by the Document Review Services, Section 274, for public release, presentation, and/or printing in the open literature:

Active Region Sources of Solar Wind at Solar Activity  
Maximum

This clearance is issued for an abstract and is valid for U.S. and foreign release.

Add to your affiliation: California Institute of Technology.  
This abstract is for an oral presentation for a foreign conference. The autho has signed Form 2785 attesting to the fact that if anything other than the abstract is to be published, he will have the full paper cleared before external release.

Clearance issued by

Linda Worrel  
Document Review Services  
Section 274

JET PROPULSION LABORATORY

INTEROFFICE MEMORANDUM

To: Linda → 46281

To: Document Review

Subject: Author Certification for Oral Presentation

Title of Abstract/Presentation:

Active Region Sources of Solar Wind at Solar Activity Maximum

Conference/Meeting:

Stereo Science Working Team meeting

Date(s)/Location:

3/21/02 Ecole Polytechnique, Paris, FR

This is a request that the abstract named above be used to clear the oral presentation that will take place at the conference/meeting and date/location shown above.

I certify the following:

If this presentation is to be published in any way, I will submit a separate clearance form (JPL form 1330) for it. I understand that clearance based on an abstract is for an oral presentation only. Only the abstract, as cleared, may be published—say, as part of conference proceedings—based on this clearance.

The presentation will accurately present the relationship among JPL, Caltech, and NASA, and will accurately present the funding source.

The presentation will accurately credit work originated by non-JPL authors or from other sources.

The presentation will NOT:

- Describe technology, including devices or methods or computer programs, except what has already been specifically reported in the open literature, in a JPL document that has been cleared for external release (Clearance Number \_\_\_\_\_), or in New Technology Report (NTR) \_\_\_\_\_.
- Reveal software code or classified, proprietary, discreet, or patentable information. (This information may include budget and cost data, nuclear power, implementation plans related to planetary protection requirements, and implementation plans for sample-return Earth landing sites.)
- Endorse vendor products or services.
- Contain statements that might adversely affect the image or reputation of JPL, Caltech, NASA, or other sponsor.
- Contain statements with national, international, or interagency political implications.
- Contain personal aggrandizement.
- Contain errors (content, language, or formatting) potentially embarrassing to JPL, Caltech, NASA, or other sponsor.

This abstract accurately represents the content of the oral presentation to follow. The oral presentation will meet the requirements defined in the policy Releasing Information Outside of JPL and the procedure Releasing Information for External Distribution, both of which I have read and understand. If I substantively change the content of the oral presentation such that this abstract no longer accurately represents its content, I will notify Document Review before the oral presentation is given, and resubmit material for a new clearance. By signing my name to this statement, I understand that I am assuming responsibility for any consequences resulting from my inappropriate disclosure of information outside JPL.

I will retain a copy of the final presentation for one year after the date of the conference/meeting listed at the beginning of this memo and will make it available for compliance reviews if requested.

Active Region Sources of Solar Wind at Solar Activity Maximum

P. C. Liewer and M. Neugebauer JPL

Two step (ballistic plus potential magnetic field) mapping of solar wind from ACE and Ulysses to the solar surface has shown that both coronal holes (as seen in Helium 10830 A) and active regions are sources of solar wind during solar activity maximum (Neugebauer et. al, to be published, JGR 2002). In Neugebauer et. al (2002), the source region was designated as an active region if the field lines threading the spacecraft mapped to a strong magnetic field region with no Helium 10830 A coronal hole nearby. Here, we continue to explore these active region solar wind sources by (a) determining the corresponding NOAA active region designation of the source; (b) using the potential field model to determine the geometry of both open and closed field lines emanating from the active region; and (c) characterizing the coronal structure above the source region as seen in soft X-rays (Yohkoh/SXT) and EUV (SOHO/EIT) images. The observed coronal structures are compared to the magnetic structure of the corona from the potential magnetic field model to understand how the open flux relates to the closed flux of the active region. To date, we have found two types of magnetic topology. In one type, the source region is a lane of open flux between two arcades of closed loops connecting the active region field to nearby regions of opposite polarity. The lane of open flux has a corresponding low emissivity soft X-ray and EUV feature; this is the topology found by Levine et al (Ap J, 1977) in an analysis of Skylab data. In the second type of topology, the open flux comes from the edge of the strong field region on the side away from the opposite-polarity region to which the closed field lines connect. Again, a corresponding low emissivity region is evident in the coronal images. We also compare the properties of the solar wind from these active regions to the properties of the slow and fast wind observed at solar minimum.
